3 practical problems

# THE SIXTH <br> INTERNATIONAL CHEMISTRY OLYMPIAD 1-10 JULY 1974, BUCURESTI, ROMANIA 

## THEORETICAL PROBLEMS

## PROBLEM 1

By electrochemical decomposition of water, there are in an electric circuit a voltmeter, platinum electrodes and a battery containing ten galvanic cells connected in series, each of it having the voltage of 1.5 V and internal resistance of $0.4 \Omega$. The resistance of the voltmeter is $0.5 \Omega$ and the polarisation voltage of the battery is 1.5 V . Electric current flows for 8 hours, 56 minutes and 7 seconds through the electrolyte. Hydrogen obtained in this way was used for a synthesis with another substance, thus forming a gaseous substance $\mathbf{A}$ which can be converted by oxidation with oxygen via oxide to substance $\mathbf{B}$.

By means of substance $\mathbf{B}$ it is possible to prepare substance $\mathbf{C}$ from which after reduction by hydrogen substance D can be obtained. Substance D reacts at $180^{\circ} \mathrm{C}$ with a concentration solution of sulphuric acid to produce sulphanilic acid. By diazotization and successive copulation with $\mathrm{p}-\mathrm{N}, \mathrm{N}$-dimethylaniline, an azo dye, methyl orange is formed.

## Problems:

1. Write chemical equations for all the above mentioned reactions.
2. Calculate the mass of product $\mathbf{D}$.
3. Give the exact chemical name for the indicator methyl orange. Show by means of structural formulas what changes take place in dependence on concentration of $\mathrm{H}_{3} \mathrm{O}^{+}$ ions in the solution.

Relative atomic masses: $\quad A_{r}(\mathrm{~N})=14 ; \quad A_{r}(\mathrm{O})=16 ; \quad A_{r}(\mathrm{C})=12 ; \quad A_{r}(\mathrm{H})=1$.

## SOLUTION

1. $\mathrm{N}_{2}+3 \mathrm{H}_{2} \rightleftharpoons 2 \mathrm{NH}_{3}$
(A)

$$
\begin{aligned}
& 4 \mathrm{NH}_{3}+5 \mathrm{O}_{2} \rightarrow 4 \mathrm{NO}+6 \mathrm{H}_{2} \mathrm{O} \\
& 2 \mathrm{NO}+\mathrm{O}_{2} \rightarrow 2 \mathrm{NO}_{2} \\
& 2 \mathrm{NO}_{2}+\mathrm{H}_{2} \mathrm{O}+1 / 2 \mathrm{O}_{2} \rightarrow 2 \mathrm{HNO}_{3}
\end{aligned}
$$

(B)

(D)

4'-dimethyl amino 4-azo benzene sulphonic acid
2. $m=\frac{M}{F_{z}} I t$

$$
\begin{aligned}
& F=96500 \mathrm{C} \mathrm{~mol}^{-1} \\
& I=\frac{\mathrm{b} E_{b}-E_{p}}{R_{v}+\mathrm{b} R_{i}}=\frac{(10 \times 1.5 \mathrm{~V})-1.5 \mathrm{~V}}{0.5 \Omega+(10 \times 0.4 \Omega)}=3 \mathrm{~A}
\end{aligned}
$$

b - number of batteries,
$E_{\mathrm{b}}$ - voltage of one battery,
$E_{\mathrm{p}}$ - polarisation voltage,
$R_{\mathrm{v}}$ - resistance of voltmeter,
$R_{\mathrm{i}} \quad$ - internal resistance of one battery
$m\left(\mathrm{H}_{2}\right)=\frac{1 \mathrm{~g} \mathrm{~mol}^{-1}}{96500 \mathrm{C} \mathrm{mol}^{-1}} \times 3 \mathrm{~A} \times 32167 \mathrm{~s}=1 \mathrm{~g}$

## From equations:

$1 \mathrm{~g} \mathrm{H}_{2}$ i. e. $0.5 \mathrm{~mol} \mathrm{H}_{2}$ corresponds $\frac{1}{3} \mathrm{~mol} \mathrm{NH}_{3} \ldots . \frac{1}{3} \mathrm{~mol} \mathrm{HNO}_{3} \ldots . \frac{1}{3} \mathrm{~mol} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NO}_{2}$ .... $\frac{1}{3} \operatorname{mol~C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}$
(D)

The mass of product $\mathbf{D}$ :

$$
m=n M=31 \mathrm{~g} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}
$$

3. 

## PROBLEM 2

Substance G can be prepared by several methods according to the following scheme:

Compound $\mathbf{A}$ is 48.60 mass \% carbon, 8.10 \% hydrogen, and 43.30 \% oxygen. It reacts with a freshly prepared silver(I) oxide to form an undissolved salt. An amount of 1.81 g of silver $(\mathrm{I})$ salt is formed from 0.74 g of compound $\mathbf{A}$.

Compound D contains 54.54 mass \% of carbon, 9.09 \% of hydrogen, and $36.37 \%$ of oxygen. It combines with $\mathrm{NaHSO}_{3}$ to produce a compound containing $21.6 \%$ of sulphur. Problems:

1. Write summary as well as structural formulas of substances $\mathbf{A}$ and $\mathbf{D}$.
2. Write structural formulas of substances B, C, E, F, and G.
3. Classify the reactions in the scheme marked by arrows and discuss more in detail reactions $\mathbf{B} \rightarrow \mathbf{G}$ and $\mathbf{D} \rightarrow \mathbf{E}$.
4. Write structural formulas of possible isomers of substance $\mathbf{G}$ and give the type of isomerism.

Relative atomic masses:
$A_{r}(\mathrm{C})=12 ; \quad A_{r}(\mathrm{H})=1 ; \quad A_{r}(\mathrm{O})=16 ; \quad A_{r}(\mathrm{Ag})=108 ; \quad A_{r}(\mathrm{Na})=23 ; \quad A_{r}(\mathrm{~S})=32$.

## SOLUTION

## 1. Compound $\mathbf{A}$ :

$\mathrm{R}-\mathrm{COOH}+\mathrm{AgOH} \rightarrow \mathrm{R}-\mathrm{COOAg}+\mathrm{H}_{2} \mathrm{O}$
A: $\left(\mathrm{C}_{x} \mathrm{H}_{y} \mathrm{O}_{z}\right)_{n}$
$x: y: z=\frac{48.60}{12}: \frac{8.10}{1}: \frac{43.30}{16}=1: 2: 0.67$
If $\mathrm{n}=3$, then the summary formula of substance $\mathbf{A}$ is: $\mathrm{C}_{3} \mathrm{H}_{6} \mathrm{O}_{2}$.
$M(\mathbf{A})=74 \mathrm{~g} \mathrm{~mol}^{-1}$
$\mathbf{A}=\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{COOH}$

## Compound D:

$\left(\mathrm{C}_{\mathrm{p}} \mathrm{H}_{\mathrm{q}} \mathrm{O}_{\mathrm{r}}\right)_{\mathrm{n}}$

If $n=2$, then the summary formula of substance $\mathbf{D}$ is: $\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{O}$.
$M(\mathbf{D})=44 \mathrm{~g} \mathrm{~mol}^{-1}$

D $=\mathrm{CH}_{3}-\mathrm{CHO}$
Reaction:
The reduction product contains 21.6 \% of sulphur.

## PROBLEM 3

The following 0.2 molar solutions are available:
A: HCl
B: $\mathrm{HSO}_{4}^{-}$
C: $\mathrm{CH}_{3} \mathrm{COOH}$
D: NaOH
E: $\quad \mathrm{CO}_{3}^{2-}$
F: $\quad \mathrm{CH}_{3} \mathrm{COONa}$
G: $\mathrm{HPO}_{4}^{2-}$
H: $\mathrm{H}_{2} \mathrm{SO}_{4}$

## Problems:

1. Determine the concentration of $\mathrm{H}_{3} \mathrm{O}^{+}$ions in solution $\mathbf{C}$.
2. Determine pH value in solution $\mathbf{A}$.
3. Write an equation for the chemical reaction that takes place when substances $\mathbf{B}$ and E are allowed to react and mark conjugate acid-base pairs.
4. Compare acid-base properties of substances $\mathbf{A}, \mathbf{B}_{s}$ and $\mathbf{C}$ and determine which one will show the most basic properties. Explain your decision.
5. Write a chemical equation for the reaction between substances $\mathbf{B}$ and $\mathbf{G}$, and explain the shift of equilibrium.
6. Write a chemical equation for the reaction between substances $\mathbf{C}$ and $\mathbf{E}$, and explain the shift of equilibrium.
7. Calculate the volume of $\mathbf{D}$ solution which is required to neutralise $20.0 \mathrm{~cm}^{3}$ of $\mathbf{H}$ solution.
8. What would be the volume of hydrogen chloride being present in one litre of $\mathbf{A}$ solution if it were in gaseous state at a pressure of 202.65 kPa and a temperature of $37{ }^{\circ} \mathrm{C}$ ?

Ionisation constants:

$$
\begin{array}{ll}
\mathrm{CH}_{3} \mathrm{COOH}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}_{3} \mathrm{O}^{+} & K_{\mathrm{a}}=1.8 \times 10^{-5} \\
\mathrm{H}_{2} \mathrm{CO}_{3}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{HCO}_{3}^{-}+\mathrm{H}_{3} \mathrm{O}^{+} & K_{\mathrm{a}}=4.4 \times 10^{-7} \\
\mathrm{HCO}_{3}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{CO}_{3}^{2-}+\mathrm{H}_{3} \mathrm{O}^{+} & K_{\mathrm{a}}=4.7 \times 10^{-11} \\
\mathrm{HSO}_{4}^{2-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{SO}_{4}^{2-}+\mathrm{H}_{3} \mathrm{O}^{+} & K_{\mathrm{a}}=1.7 \times 10^{-2} \\
\mathrm{HPO}_{4}^{2-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{PO}_{4}^{3-}+\mathrm{H}_{3} \mathrm{O}^{+} & K_{\mathrm{a}}=4.4 \times 10^{-13}
\end{array}
$$

Relative atomic masses:
$A_{r}(\mathrm{Na})=23 ; \quad A_{r}(\mathrm{~S})=32 ; \quad A_{\mathrm{r}}(\mathrm{O})=16$.

## SOLUTION

1. $\mathrm{CH}_{3} \mathrm{COOH}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$
$K_{a}=\frac{\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\right]\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}{\left[\mathrm{CH}_{3} \mathrm{COOH}\right]}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{2}}{c}$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\sqrt{K_{a} c}=\sqrt{1.8 \times 10^{-5} \times 0.2}=1.9 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
2. $\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=-\log 0.2=0.7$
3. $\begin{gathered}\mathrm{HSO}_{4}^{2-}+\overparen{\mathrm{CO}_{3}^{2-}} \rightleftharpoons \underset{\mathrm{B}_{2}}{\mathrm{SO}_{4}^{2-}}+\mathrm{HCO}_{3}^{-} \\ \mathrm{A}_{1} \\ \mathrm{~B}_{2}\end{gathered}$
4. By comparison of the ionisation constants we get:
$K_{\mathrm{a}}(\mathrm{HCl})>K_{\mathrm{a}}\left(\mathrm{HSO}_{4}^{-}\right)>K_{\mathrm{a}}\left(\mathrm{CH}_{3} \mathrm{COOH}\right)$
Thus, the strength of the acids in relation to water decreases in the above given order.
$\mathrm{CH}_{3} \mathrm{COO}^{-}$is the strongest conjugate base, whereas $\mathrm{Cl}^{-}$is the weakest one.
5. $\mathrm{HSO}_{4}^{-}+\mathrm{HPO}_{4}^{2-} \rightleftharpoons \mathrm{H}_{2} \mathrm{PO}_{4}^{-}+\mathrm{SO}_{4}^{2-}$
$K_{a}\left(\mathrm{HSO}_{4}^{-}\right) \gg K_{a}\left(\mathrm{HPO}_{4}^{2-}\right)$
Equilibrium is shifted to the formation of $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$and $\mathrm{SO}_{4}^{2-}$.
6. $\mathrm{CH}_{3} \mathrm{COOH}+\mathrm{CO}_{3}^{2-} \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{HCO}_{3}^{-}$
$\mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{HCO}_{3}^{-} \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}_{2} \mathrm{CO}_{3}$
$K_{a}\left(\mathrm{CH}_{3} \mathrm{COOH}\right)>K_{\mathrm{a}}\left(\mathrm{H}_{2} \mathrm{CO}_{3}\right)>K_{\mathrm{a}}\left(\mathrm{HCO}_{3}^{-}\right)$
Equilibrium is shifted to the formation of $\mathrm{CH}_{3} \mathrm{COO}^{-}$a $\mathrm{H}_{2} \mathrm{CO}_{3}$.
7. $n\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)=c V=0.2 \mathrm{~mol} \mathrm{dm}^{-3} \times 0.02 \mathrm{dm}^{3}=0.004 \mathrm{~mol}$

8. $\quad V(\mathrm{HCl})=\frac{n R T}{p}=\frac{0.2 \mathrm{~mol} \times 8.314 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1} \times 310 \mathrm{~K}}{202.65 \mathrm{kPa}}=2.544 \mathrm{dm}^{3}$

## PROBLEM 4

A mixture contains two organic compounds, A and B. Both of them have in their molecules oxygen and they can be mixed together in arbitrary ratios. Oxidation of this mixture on cooling yields the only substance $\mathbf{C}$ that combines with $\mathrm{NaHSO}_{3}$. The ratio of the molar mass of the substance being formed in the reaction with $\mathrm{NaHSO}_{3}$ to that of substance $\mathbf{C}$, is equal to 2.7931 .

The mixture of substances $\mathbf{A}$ and $\mathbf{B}$ is burned in the presence of a stoichiometric amount of air ( $20 \% \mathrm{O}_{2}$ and $80 \%$ of $\mathrm{N}_{2}$ by volume) in an eudiometer to produce a mixture of gases with a total volume of $5.432 \mathrm{dm}^{3}$ at STP. After the gaseous mixture is bubbled through a $\mathrm{Ba}(\mathrm{OH})_{2}$ solution, its volume is decreased by $15.46 \%$.

Problems:
4.1 Write structural formulas of substance $\mathbf{A}$ and $\mathbf{B}$.
4.2 Calculate the molar ratio of substances $\mathbf{A}$ and $\mathbf{B}$ in the mixture.

$$
A_{r}(\mathrm{C})=12 ; \quad A_{r}(\mathrm{O})=16 ; \quad A_{r}(\mathrm{~S})=32 ; \quad A_{r}(\mathrm{Na})=23 .
$$

## SOLUTION

## 4.1

$$
M_{r}(\mathbf{C}) \quad M_{r}\left(\mathrm{NaHSO}_{3}\right)=104 \quad M_{r}(\mathbf{C})+104
$$

$$
\frac{M_{\mathrm{r}}(\mathbf{C})+104}{M_{\mathrm{r}}(\mathbf{C})}=2.7931 \quad M_{\mathrm{r}}(\mathbf{C})=58
$$

A ... $\mathrm{CH}_{3}-\underset{\mathrm{OH}}{\mathrm{CH}}-\mathrm{CH}_{3}$
C ...

4.2 At STP conditions the gaseous mixture can only contain $\mathrm{CO}_{2}$ and $\mathrm{N}_{2}$. Carbon dioxide is absorbed in a barium hydroxide solution and therefore:

B ...

(a) $V\left(\mathrm{CO}_{2}\right)=5.432 \mathrm{dm}^{3} \times 0.1546=0.84 \mathrm{dm}^{3}$
(b) $V\left(\mathrm{~N}_{2}\right)=5.432 \mathrm{dm}^{3}-0.84 \mathrm{dm}^{3}=4.592 \mathrm{dm}^{3}$
(c) $\mathrm{CH}_{3}-\mathrm{CHOH}-\mathrm{CH}_{3}+9 / 2\left(\mathrm{O}_{2}+4 \mathrm{~N}_{2}\right)=3 \mathrm{CO}_{2}+4 \mathrm{H}_{2} \mathrm{O}+18 \mathrm{~N}_{2}$
(d) $\mathrm{CH}_{3}-\mathrm{CO}-\mathrm{CH}_{3}+4\left(\mathrm{O}_{2}+4 \mathrm{~N}_{2}\right)=3 \mathrm{CO}_{2}+3 \mathrm{H}_{2} \mathrm{O}+16 \mathrm{~N}_{2}$

Let us mark the amounts of substances as:
$n\left(\mathrm{CH}_{3}-\mathrm{CHOH}-\mathrm{CH}_{3}\right)=x$
$n\left(\mathrm{CH}_{3}-\mathrm{CO}-\mathrm{CH}_{3}\right)=y$
From equations (a), (c) and (d):
(e) $(3 x \times 22.4)+(3 y \times 22.4)=0.84$

From equations (b), (c) and (d):
(f) $\quad(18 x \times 22.4)+(16 y \times 22.4)=4.592$

In solving equations (e) and (f) we get:
$x=0.0025 \mathrm{~mol} y=0.01 \mathrm{~mol}$
$\frac{x}{y}=\frac{1}{4}$

## PROBLEM 5

A mixture of two metals found in Mendelejev's periodical table in different groups, reacted with $56 \mathrm{~cm}^{3}$ of hydrogen on heating (measured at STP conditions) to produce two ionic compounds. These compounds were allowed to react with 270 mg of water but only one third of water reacted. A basic solution was formed in which the content of hydroxides was $30 \%$ by mass and at the same time deposited a precipitate with a mass that represented 59.05 \% of a total mass of the products formed by the reaction. After filtration the precipitate was heated and its mass decreased by 27 mg .

When a stoichiometric amount of ammonium carbonate was added to the basic solution, a slightly soluble precipitate was obtained, at the same time ammonia was liberated and the content of hydroxides in the solution decreased to $16.81 \%$.

## Problem:

5.1 Determine the metals in the starting mixture and their masses.

## SOLUTION

Ionic hydrides are formed by combining of alkali metals or alkaline earth metals with hydrogen. In relation to the conditions in the task, there will be an alkali metal ( $\mathrm{M}^{\prime}$ ) as well as an alkaline earth metal $\left(M^{\prime \prime}\right)$ in the mixture.
Equations:
$M^{\prime}+1 / 2 H_{2} \rightarrow M^{\prime} H$
(2) $M^{\prime \prime}+\mathrm{H}_{2} \rightarrow \mathrm{M}^{\text {I }} \mathrm{H}_{2}$
(3) $\mathrm{M}^{\prime} \mathrm{H}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{M}^{\prime} \mathrm{OH}+\mathrm{H}_{2}$
(4) $\mathrm{M}^{\text {I }} \mathrm{H}_{2}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{M}^{\text {II }}(\mathrm{OH})_{2}+2 \mathrm{H}_{2}$
reacted: $0.09 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}$, i. e. 0.005 mol
unreacted: $0.18 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}$, i. e. 0.01 mol
Since all hydroxides of alkali metals are readily soluble in water, the undissolved precipitate is $\mathrm{M}^{\prime \prime}(\mathrm{OH})_{2}$, however, it is slightly soluble in water, too.

Thus, the mass of hydroxides dissolved in the solution:
$m^{\prime}\left(\mathrm{M}^{\prime} \mathrm{OH}+\mathrm{M}^{\prime \prime}(\mathrm{OH})_{2}\right)=\mathrm{Z}$

Therefore:
$30=\frac{Z}{Z+0.18} \times 100 \quad Z=0.077 \mathrm{~g}$
(6) $m^{\prime}\left(\mathrm{M}^{\prime} \mathrm{OH}+\mathrm{M}^{\prime \prime}(\mathrm{OH})_{2}\right)=0.077 \mathrm{~g}$

It represents $40.95 \%$ of the total mass of the hydroxides, i. e. the total mass of hydroxides is as follows:
(7) $\quad m^{\prime}\left(\mathrm{M}^{\prime} \mathrm{OH}+\mathrm{M}^{\prime \prime}(\mathrm{OH})_{2}\right)=\frac{0.077 \mathrm{~g} \times 100}{40.95}=0.188 \mathrm{~g}$

The mass of solid $\mathrm{M}^{\prime \prime}(\mathrm{OH})_{2}$ :
(8) $0.188 \mathrm{~g}-0.077 \mathrm{~g}=0.111 \mathrm{~g}$

Heating:
(9) $\mathrm{M}^{\mathrm{I}}(\mathrm{OH})_{2} \rightarrow \mathrm{M}^{\mathrm{II}} \mathrm{O}+\mathrm{H}_{2} \mathrm{O}$

Decrease of the mass: $0.027 \mathrm{~g}\left(\mathrm{H}_{2} \mathrm{O}\right)$
(10) Mass of M ${ }^{\text {II }}$ : 0.084 g

In relation to (8), (9), and (10):
$\frac{M_{r}\left(M^{\prime \prime} O\right)}{M_{r}\left(M^{\prime \prime} O\right)+18}=\frac{0.084}{0.111}$
$M_{r}\left(\mathrm{M}^{\text {II }} \mathrm{O}\right)=56 \mathrm{~g} \mathrm{~mol}^{-1}$
$M_{r}\left(\mathrm{M}^{\mathrm{II}}\right)=M_{r}\left(\mathrm{M}^{\mathrm{II}} \mathrm{O}\right)-M_{r}(\mathrm{O})=56-16=40$
$\mathrm{M}^{\prime \prime}=\mathrm{Ca}$

Precipitation with $\left(\mathrm{NH}_{4} \mathrm{CO}_{3}\right)$ :
(11)
$\mathrm{Ca}(\mathrm{OH})_{2}+\left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3} \rightarrow \mathrm{CaCO}_{3}+2 \mathrm{NH}_{3}+2 \mathrm{H}_{2} \mathrm{O}$
According to (5) and (6) the mass of the solution was:
$0.18 \mathrm{~g}+0.077 \mathrm{~g}=0.257 \mathrm{~g}$
After precipitation with $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3}$ :
$16.81=\frac{m\left(\text { M }^{\prime} \mathrm{OH}\right)}{m(\text { solution })} \times 100$
Let us mark as $n^{\prime}$ the amount of substance of $\mathrm{Ca}(\mathrm{OH})_{2}$ being present in the solution.
$M\left(\mathrm{Ca}(\mathrm{OH})_{2}\right)=74 \mathrm{~g} \mathrm{~mol}^{-1}$
Taking into account the condition in the task as well as equation (11), we get:
$16.81=\frac{\left(0.077-74 n^{\prime}\right) \times 100}{0.257-74 n^{\prime}+2 n^{\prime} \times 18}$

$$
n^{\prime}=5 \times 10^{-4} \mathrm{~mol}
$$

The total amount of substance of $\mathrm{Ca}(\mathrm{OH})_{2}$ (both in the precipitate and in the solution):
(12) $n\left(\mathrm{Ca}(\mathrm{OH})_{2}\right)=\frac{0.111 \mathrm{~g}}{74 \mathrm{~g} \mathrm{~mol}^{-1}}+5 \times 10^{-4} \mathrm{~mol}=0.002 \mathrm{~mol}$ (i. e. 0.148 g$)$

According to equations (3) and (4):
$n\left(\mathrm{H}_{2} \mathrm{O}\right)=0.004 \mathrm{~mol} \quad\left(\right.$ for $\left.\mathrm{M}^{11} \mathrm{H}_{2}\right)$
$n\left(\mathrm{H}_{2} \mathrm{O}\right)=0.001 \mathrm{~mol} \quad\left(\right.$ for $\left.\mathrm{M}^{\prime} \mathrm{H}\right)$
$n\left(\mathrm{M}^{\prime} \mathrm{OH}\right)=0.001 \mathrm{~mol}$

According to equations (7) and (11):
$m\left(\mathrm{M}^{\prime} \mathrm{OH}\right)=0.188 \mathrm{~g}-0.148 \mathrm{~g}=0.04 \mathrm{~g}$
$M\left(\mathrm{M}^{\prime} \mathrm{OH}\right)=\frac{m\left(\mathrm{M}^{\prime} \mathrm{OH}\right)}{n\left(\mathrm{M}^{\prime} \mathrm{OH}\right)}=\frac{0.04 \mathrm{~g}}{0.001 \mathrm{~mol}}=40 \mathrm{~g} \mathrm{~mol}^{-1}$
$\mathrm{M}^{\prime} \mathrm{OH}=\mathrm{NaOH}$

Composition of the mixture:
0.002 mol Ca +0.001 mol Na
or
$0.080 \mathrm{~g} \mathrm{Ca}+0.023 \mathrm{~g} \mathrm{Na}$

## PRACTICAL PROBLEMS

## PROBLEM 1 (practical)

Test tubes with unknown samples contain:

- a salt of carboxylic acid,
- a phenol,
- a carbohydrate,
- an amide.

Determine the content of each test tube using reagents that are available on the laboratory desk.

## PROBLEM 2 (practical)

Determine cations in solutions No 5, 6, 8 and 9 using the solution in test tube 7 .
Without using any indicator find out whether the solution in test tube 7 is an acid or a hydroxide.

## SOLUTION

Test tube: No $5-\mathrm{NH}_{4}^{+} ; \quad$ No $6-\mathrm{Hg}^{2+} ; \quad \mathrm{No} 7-\mathrm{OH}^{-} ; \quad \mathrm{No} 8-\mathrm{Fe}^{3+} ; \quad \mathrm{No} 9-\mathrm{Cu}^{2+}$

## PROBLEM 3 (practical)

The solution in test tube No 10 contains two cations and two anions.
Prove those ions by means of reagents that are available on the laboratory desk.

## SOLUTION

The solution in test tube No 10 contained: $\mathrm{Ba}^{2+}, \mathrm{Al}^{3+}, \mathrm{Cl}^{-}, \mathrm{CO}_{3}^{2-}$
